1 Consider a reinforcement learning scenario where an agent is tasked to navigate through a maze and r...

' **Answer: See rubric**

Explanation: This problem requires applying reinforcement learning algorithms to train an agent on how to navigate a maze. The complexity of the dynamics comes from both reaching goals and avoiding traps that negatively impact its score.

2 Develop a reinforcement learning agent that can navigate and learn to solve puzzles in the 'MiniGrid...

' **Answer: See rubric**

Explanation: This problem requires you to apply reinforcement learning techniques such as Q-learning or policy gradients. The agent must learn the optimal actions through trial and error by receiving rewards for desirable outcomes (e.g., reaching a goal, collecting objects) and penalties for undesirable ones.
